How to determine if the pump is functioning on your liquid cooler. The only way to accurately determine if your Liquid Cooling Pump is functioning, is by checking the Pump RPM. This will only be possible if the pump cable is connected directly to a fan header on the motherboard. You will not be able to obtain a pump RPM reading if the pump cable is connected to the power supply via 4 pin Molex to 3 pin fan adapter.

Automatically shutting off of the pump may seem like an "out-of-your-league" electric process, but actually, it's not an electric process at all. In fact, it is a mechanical process – and a rather innovative one at that! It involves a very interesting physical phenomenon, known as the Venturi effect. Let's take a closer look.

How Does The Gas Pump Know When The Car's Tank Is Full?

It's purely mechanical -- and ingenious. Near the tip of the nozzle is a small hole, and a small pipe leads back from the hole into the handle. Suction is applied to this pipe using a venturi. When the tank is not full, air is being drawn through the hole by the vacuum, and the air flows easily. When gasoline in the tank rises high enough to block the hole, a mechanical linkage in the handle senses the change in suction and flips the nozzle off.

A pump is a device that moves fluids, or sometimes slurries, by mechanical action, typically converted from electrical energy into Hydraulic energy. Pumps can be classified into three major groups according to the method they use to move the fluid: direct lift, displacement, and gravity pumps. Pumps operate by some mechanism, and consume energy to perform mechanical work moving the fluid. Pumps operate via many energy sources, including manual operation, electricity, engines, or wind power. and

The are two main components that make most fuel pumps run: the PCM (Powertrain Control Module) and the fuel pump relay. Fuel pumps themselves don't know when to shut off. They are entirely dependant on the fuel pump relay to provide them with power or remove their power. The fuel pump relay is controlled by the PCM by providing the relay with a ground.

It's time to talk sump pumps. Are you drawing a blank and wondering, "What is a sump pump, and why do I need a sump pump?" Let's start by saying that a lot of basements flood—especially if they're located below the water table. So a sump pump is designed to pump the water out of there and funnel it away from the house to a storm drain or a well.

Understanding hydraulics and pump operations doesn't have to be difficult, and it is of key importance to the science of fire engineering. Putting all the pieces together correctly so that the right stream is brought to the fire is essential to effective fireground operations. In the second edition of Fire Service Hydraulics and Pump Operations, author Paul Spurgeon, engineer/pump operator with the Denver Fire Department, breaks down the sometimes difficult-to-understand formulas of hydraulics and pumps into easily learned steps, taking care to explain the hows and whys of each formula discussed. Using an in-the-street, practical approach, Spurgeon teaches readers how to develop proper fire streams as well as how they relate to overall fireground strategies. He covers hydraulics and pumps extensively—from the properties of water to its supply to pumping to sprinkler systems and foams. So readers can put what they've learned into practice, Spurgeon provides both end-of-chapter tests and practice sets at the end of the book, complete with answers so that readers can check their knowledge. The second edition includes numerous updates and additions, including the Rule of Thumb chapter that illustrates how to perform these complex calculations while under stress on the fireground. This text meets the learning objectives for FESHE Fire Protection Hydraulics and Water Supply course work.
Features and Benefits:
• Summary of chapter formulas
• End-of-chapter tests with answers
• Practice sets with answers to further test your understanding
