Evolution of Stars. The interior of a typical main sequence star is illustrated by the internal conditions of the Sun, with the highest density, pressure, energy generation rate, and temperature occurring at the very center. The temperature dependency of the proton-proton cycle means that energy is produced over a fairly large volume in the stellar center, out to about 25 percent of the total stellar radius in a star like the Sun.

The evolution of a star can be described in terms of changes in its temperature and luminosity, which can best be followed by plotting them on an H-R diagram. Protostars generate energy (and internal heat) through gravitational contraction that typically continues for millions of years, until the star reaches the main sequence.

Birth of stars and evolution to the main sequence. Detailed radio maps of nearby molecular clouds reveal that they are clumpy, with regions containing a wide range of densities—from a few tens of molecules (mostly hydrogen) per cubic centimetre to more than one million. Stars form only from the densest regions, termed cloud cores, though they need not lie at the geometric centre of the cloud.

Determine the age of a protostar using an H-R diagram and the protostar's luminosity and temperature. Explain the interplay between gravity and pressure, and how the contracting protostar changes its position in the H-R diagram as a result. One of the best ways to summarize all of these details about how a star or protostar changes with time is to use a Hertzsprung-Russell (H-R) diagram.

Star formation and evolution The range of physically allowable masses for stars is very narrow. If the star's mass is too small, the central temperature will be too low to sustain fusion reactions. The theoretical minimum stellar mass is about 0.08 solar mass.

In 1987 Ken Ham wrote what would become a prophetic warning to the Church about the destructive effects of compromise with evolutionary ideas, and how this compromise undermines Scriptural authority and erodes Christian confidence in the infallibility of God's Word. Today we have Christians not only confused when it comes to Genesis and age of the earth, but even the reality of Hell, Adam as a real person, and Christ's own words about creation, marriage and more are being debated in the pulpits across the world. In this special revised and updated edition, Ken Ham again takes the lead in pointing out the looming precipice the Church is rushing towards, how evolution and/or millions of years, is driving away young people of the faith, and the biblical solution that can change it!

Evolution of Stars and Stellar Populations is a comprehensive presentation of the theory of stellar evolution and its application to the study of stellar populations in galaxies. Taking a unique approach to the subject, this self-contained text introduces first the theory of stellar evolution in a clear and accessible manner, with particular emphasis placed on explaining the evolution with time of observable stellar properties, such as luminosities and surface chemical abundances. This is followed by a detailed presentation and discussion of a broad range of related techniques, that are widely applied by researchers in the field to investigate the formation and evolution of galaxies. This book will be invaluable for undergraduates and graduate students in astronomy and astrophysics, and will also be of interest to researchers working in the field of Galactic, extragalactic astronomy and cosmology. comprehensive presentation of stellar evolution theory introduces the concept of stellar population and describes "stellar population synthesis" methods to study ages and star formation histories of star clusters and galaxies presents stellar evolution as a tool for investigating the evolution of galaxies and of the universe in general
