For flat roof construction the target should be lower at a maximum of  $3\text{m}^3/(\text{h} \cdot \text{m}^2)$ .

(Passivhaus requires  $0.6\text{m}^3/(\text{h} \cdot \text{m}^2)$ )

Frequently, the design airtightness value differs considerably from the actual as-built value. A blower door test would help to detect leakages and ensure the performance of the construction is as designed and required.
