Providing a practical guide to the training and assessment of non-technical skills within high-risk industries, this book will be of direct interest to safety and training professionals working within aviation, healthcare, rail, maritime, and other high-

Currently, each of these industries are working to integrate non-technical skills into their training and certification processes, particularly in light of increasing international regulation in this area. However, there is no definitive guidance to assist practitioners within these areas with the

design of effective non-technical skills training and assessment programs. This book sets out to fully meet this need. It has been designed as a practically focussed companion to the 2008 book Safety at the Sharp End by Flin, O'Connor and Crichton. While Safety at the Sharp End provides the definitive exploration of

the need for non-technical skills training, and examines in detail the main components of non-technical skills as they relate to safe operations, the text does not focus on the "nuts and bolts" of designing training and assessment programs. To this end, *Training and Assessing Non-Technical Skills: A Practical Guide* provides

an extension of this work and a fitting companion text.

Human error is cited over and over as a cause of incidents and accidents. The result is a widespread perception of a 'human error problem', and solutions are thought to lie in changing the people or their role in the system.

For example, we should reduce the human role with more automation, or regiment human behavior by stricter monitoring, rules or procedures. But in practice, things have proved not to be this simple. The label 'human error' is prejudicial and hides much more than it reveals about how a

takes you behind the
human error label.

Divided into five parts,
it begins by

how systems thinking
has radically changed
our understanding of
how accidents occur.
Part 3 explains the role

Part 4 studies how the

technology can increase

erroneous actions and

assessments in many different fields of practice. And Part 5 tells how the hindsight bias always enters into attributions of error, so that what we label human error actually is the result of a social and psychological judgment process by stakeholders in the system in question to focus on only a facet of a set of

interacting contributors.

If you think you have a human error problem, recognize that the label itself is no explanation and no guide to countermeasures. The potential for constructive change, for progress on safety, lies behind the human error label.

Increased concern for
