For many household surveys in the United States, response rates have been steadily declining for at least the past two decades. A similar decline in survey response can be observed in all wealthy countries. Efforts to raise response rates have used such strategies as monetary incentives or repeated attempts to contact sample members and obtain completed interviews, but these strategies increase the costs of surveys. This review addresses the core issues regarding survey nonresponse. It considers why response rates are declining and what that means for the accuracy of survey results. These trends are of particular concern for the social science community, which is heavily invested in obtaining information from household surveys. The evidence to date makes it apparent that current trends in nonresponse, if not arrested, threaten to undermine the potential of household surveys to elicit information that assists in understanding social and economic issues. The trends also threaten to weaken the validity of inferences drawn from estimates based on those surveys. High nonresponse rates create the potential or risk for bias in estimates and affect survey design, data collection, estimation, and analysis. The survey community is painfully aware of these trends and has responded aggressively to these threats. The interview modes employed by surveys in the public and private sectors have proliferated as new technologies and methods have emerged and matured. To the traditional trio of mail, telephone, and face-to-face surveys have been added interactive voice response (IVR), audio computer-assisted self-interviewing (ACASI), web surveys, and a number of hybrid methods. Similarly, a growing research agenda has emerged in the past decade or so focused on seeking solutions to various aspects of the problem of survey nonresponse; the potential solutions that have been considered range from better training and deployment of interviewers to more use of incentives, better use of the information collected in the data collection, and increased use of auxiliary information from other sources in survey design and data collection. Nonresponse in Social Science Surveys: A Research Agenda also documents the increased use of information collected in the survey process in nonresponse adjustment.

The Defense Manpower Data Center conducted a survey of DoD procurement personnel in support of the Defense Financial and Investment Review study. The questionnaire was broken down into five main sections: Section I covered respondent characteristics; Section II covered pricing policies and practices; Section III covered profit policies and practices; Section IV covered contract financing policies and practices; and Section V covered contractor investment incentive policies and practices. Responses are compared to previous profit studies for each of the subject areas. This report is not required to understand the Defense Financial and Investment Review final report, but the personnel survey does present the most current perceptions of the procurement community in the subject areas. Keywords: Capital Investment, Contract Financing, Contract Pricing, Profit Policy, Pricing, Progress Payments, Weighted Guidelines. (Author).

Praise for the First Edition "...this book is quite inspiring, giving many practical ideas for survey research, especially for designing better questionnaires." —International Statistical Review Reflecting modern developments in the field of survey research, the Second Edition of Design, Evaluation, and Analysis of Questionnaires for Survey Research continues to provide cutting-edge analysis of the important decisions researchers make throughout the survey design process. The new edition covers the essential methodologies and statistical tools utilized to create reliable and accurate survey questionnaires, which unveils the relationship between individual question characteristics and overall question quality. Since the First Edition, the computer program Survey Quality Prediction (SQP) has been updated to include new predictions of the quality of survey questions on the basis of analyses of Multi-Trait Multi-Method experiments. The improved program contains over 60,000 questions, with translations in most European languages. Featuring an expanded explanation of the usage and limitations of SQP 2.0, the Second Edition also includes:

- New practice problems to provide readers with real-world experience in survey research and questionnaire design
- A comprehensive outline of the steps for creating and testing survey questionnaires
- Contemporary examples that demonstrate the many pitfalls of questionnaire design and ways to avoid similar decisions

Design, Evaluation, and Analysis of Questionnaires for Survey Research, Second Edition is an excellent textbook for upper-undergraduate and graduate-level courses in methodology and research questionnaire planning, as well as an ideal resource for social scientists or survey researchers needing to design, evaluate, and analyze questionnaires. Design, Evaluation, and Analysis of Questionnaires for Survey Research, Second Edition is an excellent textbook for upper-undergraduate and graduate-level courses in methodology and research questionnaire planning, as well as an ideal resource for social scientists or survey researchers needing to design, evaluate, and analyze questionnaires. Includes the Annual report of the Geological Survey of India, 1867-

This report is concerned with a study of the sidelobe performance of a broad range of antenna types. The survey is based almost entirely upon data available in the open literature, although in reviewing this material, the authors have tempered the information in the light of their own experience, and that of their colleagues, in this field. The emphasis of the review has been directed toward establishing the level of sidelobe suppression which can be achieved with antennas of differing types and dimensions; and towards determining to what extent these levels represent fundamental limitations with respect to sidelobe performance. Efforts have also been made to identify the principal parameters governing the sidelobe performance for any given antenna type. The main conclusion of this survey and review is that sidelobe suppression to lower levels than that commonly achieved with existing antennas is, in many cases, both theoretically and practically feasible. The rather indifferent sidelobe performance of many existing antennas is considered to be a result of insufficient emphasis being given to this aspect of the system electrical performance. This has often led to an acceptance of levels of sidelobe radiation which, in view of the existing jamming threat, must now be considered as totally unrealistic.

The large amount of literature on the technology of thin film silicon nitride indi cates the interest of the Department of Defense, NASA and the semiconductor industry in the development and full utilization of the material. This survey is concerned only with the thin film characteristics and properties of silicon nitride as currently utilized by the semiconductor or microelectronics industry. It also includes the various methods of preparation. Applications in microelectronic devices and circuits are to be provided in Part 2 of the survey. Some bulk silicon nitride property data is included for basic reference and comparison purposes. The survey specifically excludes references and information not within the public domain. ACKNOWLEDGEMENT This survey was generated under U.S. Air Force Contract F33615-70-C-1348, with Mr. B.R. Emrich (MAAM) Air Force Materials Laboratory, Wright-Patterson Air Force Base, Ohio acting as Project Engineer. The author would like to acknowledge the assis tance of Dr. Judd Q. Bartling, Litton Systems, Inc., Guidance and Control Systems Division, Woodland Hills, California and Dr. Thomas C. Hall, Hughes Aircraft Company, Culver City, California in reviewing the survey. v CONTENTS Preface. i Introduction 1 Literature Review. 1 Bulk Characteristics 1 Technology Overview. 2 References 4 Methods of Preparation • 5 Introduction • 5 Direct Nitridation Method 8 Evaporation Method • 9 Glow Discharge Method. 10 Ion Beam Method. 13 Sputtering Methods 13 Pyrolytic Methods. 15 Silane and Ammonia Reaction 15 Silicon Tetrachloride and Tetrafluoride Reaction. 24 Silane and Hydrazine Reaction 27 Production Operations. 28 Equipment.
