This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DEcIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.

Sustainable Healthcare sets out a vision for medical care of high quality, manageable cost and low impact on the planetary systems which sustain us. In tackling the major challenges of our age, such as resource depletion, loss of biodiversity and climate change, health services can play a central role, moving from being part of the problem to becoming part of the solution. Sustainable Healthcare explores questions such as: What is the relevance of sustainability in healthcare? How does climate change threaten human health? How can we create low carbon care pathways? How can healthcare organizations deal better with their waste? How can death and dying become more sustainable? How can we engage ourselves and others with this agenda? Written by an international team combining clinical, educational, practical and policy expertise in sustainability and health, this book provides a synopsis of our current

predicaments, and explores some of the emerging solutions. Containing case studies and resources for further information and action, *Sustainable Healthcare* is a practical guide to making healthcare more sustainable for all healthcare professionals, managers and students. "Once in a while one comes across a book that makes a deep impact. *Sustainable Healthcare* is such a book and very timely in the context of modern healthcare and developing green policies... The book is clear in ideas of critical thinking, scientific evidence and practical suggestions for transformative action... An additional strength in this book are the summary key papers and reports including key points from the chapters. In addition, there is a comprehensive list of references in each chapter... The authors cut through the jargon and challenge the rhetoric of both fear and denial... The authors give examples of how we can engage with sustainability such as, diet and exercise, prescription management, contraception management and family planning and end of life care... The book provides useful sources, references and key actions for individuals, healthcare organisations and policy making departments." - A review by Prof Davinder Sandhu, Postgraduate Dean, Health Education South West, Severn Deanery, UK

In a workshop organized by the Clinical Research roundtable, representatives from purchaser organizations (employers), payer organizations (health plans and insurance companies), and other stakeholder organizations (voluntary health associations, clinical researchers, research organizations, and the technology community) came together to explore: What do purchasers and payers need from the Clinical Research Enterprise? How have current efforts in clinical research met their needs? What are purchasers, payers, and other stakeholders willing to contribute to the enterprise? This book documents these discussions and summarizes what employers and insurers need from and are willing to contribute to clinical research from both a business and a national health care perspective.
