If you understand how drugs work (pharmacodynamics), how they are handled by the body (pharmacokinetics), how they interact with each other, and how drug treatments are assessed, then you will become a better prescriber. A Textbook of Clinical Pharmacology and Therapeutics gives you that understanding. Fully revised throughout and extensively illustrated, the fifth edition of this well-established textbook has been streamlined to focus on what medical students and junior doctors really need to know in order to understand the implications of prescribing one drug over, or in combination with, another. The text provides current information on all areas of drug prescribing with updated discussion and guidance on such topics as adverse drug reactions, 'personalized medicine', gene and cell-based therapy, advances in cancer therapy, and mechanisms of drug action and treatment guidelines in HIV and mycobacterial infections therapy. A new chapter on alternative medicines and nutraceuticals has been introduced and Further Reading lists have been updated to include key medical websites. All medical students and junior doctors who read this book will learn not only how to use drugs safely and effectively, but, importantly, the rationale behind effective prescribing decisions.

Completely updated, the new edition of the Oxford Textbook of Clinical Pharmacology and Drug Therapy continues to provide medical students and clinicians with a unique insight into why drugs have their therapeutic effects, by presenting the basic principles of pharmacology as they affect the patient. An understanding of these principles is essential for rational, safe, effective, and economical prescribing. The text shows how knowledge of the scientific basis of drug action is applied in a clinical context to devise the most effective treatments for disease and to maximize the therapeutic effects of the drugs being used. This new edition includes an appraisal of the value of evidence-based medicine and a greater discussion of issues in genetics. There are specialist contributors for areas of infectious disease, gastrointestinal disorders, blood disorders, general anaesthesia, cancer chemotherapy, and immunosuppression. The revision also includes updates to both the

Clinical Pharmacology for Prescribing explains how drugs work and why they should be prescribed for common medical conditions. Linking disease processes to pharmacological interventions, this guide gives a sound basis for evidence based prescribing. Written for medical students, trainee doctors and non-medical prescribers, it addresses all aspects of practical pharmacology, explaining drug classes, their mechanisms and effects on the body. Ultimately its focus is on clinical use, so that safe prescribing decisions are based on sound understanding of science - why and how drugs work to treat common conditions. Every chapter provides clear linkages between pathophysiology of disease and drug mechanisms, highlighted in original illustrations that bring together drug mechanisms, pathways and their place in medical management. Unwanted effects, drug interactions and prescribing warnings are emphasised to help the reader become aware of critical issues in prescribing. This resource also addresses how to prescribe for vulnerable patient groups and provokes deep understanding for patient safety. Written by a Practising Pharmaceutical Physician with a D.Phil in Pharmacology, an Assistant Professor with the Faculty of Medicine and Health Sciences and a Senior hospital-based Clinical Pharmacist. The textbook has been extensively reviewed by practicing clinicians such that this new resource exemplifies the skills and knowledge needed for practical, legal and safe clinical prescribing.
