Temperament and Character Inventory - Wikipedia
The Temperament and Character Inventory (TCI) is a set of tests designed to identify the intensity of and relationships between the seven basic personality dimensions of Temperament and Character, which interact to create the unique personality of an individual.

What is the TCI? – Temperament and Character Inventory
The Temperament and Character Inventory (TCI) is an inventory for personality traits devised by Cloninger et al. [1] It is closely related to and an outgrowth of the Tridimensional Personality Questionnaire (TPQ), and it has also been related to the dimensions of personality in Zuckerman's alternative five and Eysenck's models [2] and those of the five factor model.

This Encyclopedia provides a comprehensive overview of individual differences within the domain of personality, with major sub-topics including assessment and research design, taxonomy, biological factors, evolutionary evidence, motivation, cognition and emotion, as well as gender differences, cultural considerations, and personality disorders. It is an up-to-date reference for this increasingly important area and a key resource for those who study intelligence, personality, motivation, aptitude and their variations within members of a group.

All human beings have spontaneous needs for happiness, self-understanding, and love. In *Feeling Good: The Science of Well Being*, psychiatrist Robert Cloninger describes a way to coherent living that satisfies these strong basic needs through growth in the uniquely human gift of self-awareness. The scientific findings that led Dr. Cloninger to expand his own views in a stepwise manner during 30 years of research and clinical experience are clearly presented so that readers can consider the validity of his viewpoint for themselves. The principles of well-being are based on a non-reductive scientific paradigm that integrates findings from all the biomedical and psychosocial sciences. Reliable methods are described for measuring human thought and

social relationships at each step along the path of self-aware consciousness. Practical mental exercises for stimulating the growth of self-awareness are also provided. The methods are supported by data from brain imaging, genetics of personality, and longitudinal biopsychosocial studies. *Feeling Good: The Science of Well-Being* will be of value to anyone involved in the sciences of the mind or the treatment of mental disorders. It will also interest theologians, philosophers, social scientists, and lay readers because it provides contemporary scientific concepts and language for addressing the perennial human questions about being, knowledge, and conduct.

Describes sixteen basic personality types, argues that people try to reshape their spouses, children, friends, and coworkers into models of themselves, and discusses different styles of leadership

It analyzes the association between personality and psychopathology from several interlocking perspectives -- descriptive, developmental, etiological, and therapeutic -- concluding that the association is strong and important, no matter what angle it is considered from.

The assessment of individual differences has a long history. As early as 2200 B.C. the Chinese were employing methods to select candidates for civil service positions. Over the ensuing centuries philosophers, theologians, and the nobility all noticed and debated the role of "character" in shaping the destiny and quality of individual lives. This interest spawned widely different methods of evaluating the timbre of temperament-bumps on the head, lines on the hand, shape of the body-all of which were employed in attempts to gain insight into basic human motives. The

emergence of the scientific method and its application to this endeavor reinvigorated society's efforts in this direction, and an abundant variety of assessment instruments consequently became available. The outbreak of World War I created a need for the efficient assessment of individual differences in large groups. Such instruments as the Woodworth Personal Data Sheet and the Army Alpha Test resulted in genuine breakthroughs in assessment technology. These tests provided standardized sets of items that permitted quantitative comparisons among people. Over the years, numerous scales have been developed which have been based on widely differing levels of psychometric sophistication.

The Five Factor Model, which measures individual differences on extraversion, agreeableness, conscientiousness, emotional stability, and openness to experience, is arguably the most prominent dimensional model of general personality structure. In fact, there is now a considerable body of research supporting its construct validity and practical application in clinical, health, and organizational settings. Taking this research to the forefront, The Oxford Handbook of the Five Factor Model showcases the work of expert researchers in the field as they each offer important insight and perspective on all that is known about the Five Factor Model to date. By establishing the origins, foundation, and predominance of the Five Factor Model, this Handbook will focus on such areas as construct validity, diagnosis and assessment, personality neuroscience, and how the Five Factor Model operates in business and industry, animal personality, childhood temperament, and clinical utility.

Character can be defined as self-aware knowledge that

helps the individual to set goals, values and ethical principles (Cloninger, 2004). This meta-cognitive dimension of human personality involves ' Theory of Mind ', and is positively related to measures of well-being, mental health, and constructive behavior patterns. Research from at least three different fields, cultural (Shweder, Much, Mahapatra & Park, 1997), personality (Cloninger, 2004), and social psychology (Abele & Wojcizke, 2007) suggest that character can be organized along three broad principles: agency, which is related to the autonomy and the fulfillment and enhancement of the self; communion, which is related to engagement in the protection and relations to others such as families, companies or nations; and spirituality, which is related to the human ability to transcend the self and find and interconnection with all life and appreciation of the whole world around us (Haidt, 2006; Cloninger, 2013). Using the Temperament and Character Inventory (Cloninger, Svrakic & Przybeck, 1993) researchers have found that agentic (i.e., Self-directedness) and communal (i.e., Cooperativeness) values are associated to high levels of happiness, psychological well-being, and less violent behavior. Moreover, low Self-directedness and Cooperativeness is recurrent among individuals with all types of mental health problems, such as, depression, schizophrenia, anxiety disorder, autism spectrum disorders, attention deficit/hyperactivity disorder and etcetera. Spirituality, in coherence with agency and communion, guides the individual to seek self-realization in harmony with others and nature in the changing world (Cloninger, 2013). Seeing character as self-awareness of the self in three dimensions has also been associated to human responsibility and empowerment. This research topic will focus on all article types that put forward findings regarding:

- Character as a protective factor against mental

illness. • Character ' s association to conduct disorders and violent behavior. • Character as a promoter of happiness, life satisfaction, and well-being. • The etiology of character. • Longitudinal studies on character. • Agency, communion, and spirituality as broad dimensions for the conceptualization of positive measures of mental health. • Innovative methods to measure or conceptualize character. • Non-linear effects of character on mental health. • Character as a measure/conceptualization of responsibility. • Character in school and work place settings. • Character in relation to empowerment.
