IPC Users Guide. Inter-Processor Communication (IPC) provides a processor-agnostic API which can be used for communication between processors in a multi-processor environment (inter-core), communication to other threads on same processor (inter-process), and communication to peripherals (inter-device). The API supports message passing, streams, and linked lists.

~~IPC Users Guide - Texas Instruments Wiki~~

IPC is a component containing packages that are designed to allow communication between processors in a multi-processor environment and communication to peripherals. This communication includes message passing, streams, and linked lists. These work transparently in both uni-processor and multi-processor configurations.

order to use any Notify APIs, you must first call `Ipcc_start()`. This sets up all the necessary Notify drivers, shared memory, and interprocessor interrupts.

IPC provides an implementation of the `IMessageQTransport` interface called `ti.sdo.ipc.transports.TransportShm` (shared memory). You can write other implementations to meet your needs.

When a transport is created via a transport-specific `create()` call, a remote processor ID (defined via the `MultiProc` module) is specified.
